

# Web Programming

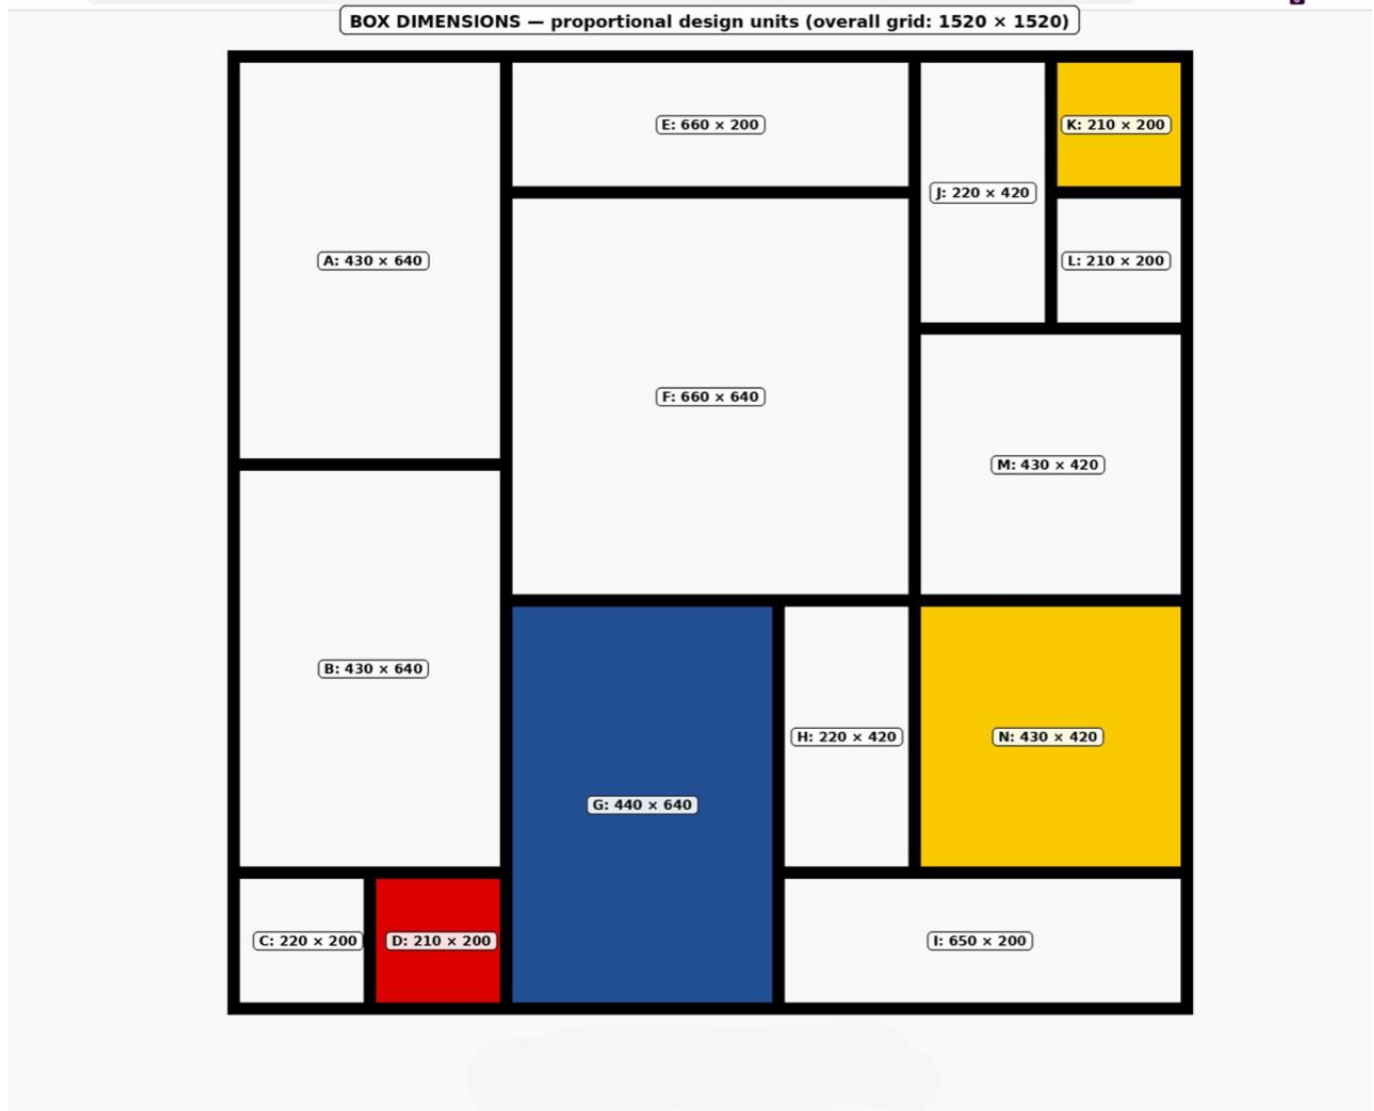

BSDS-7A, BSCS-7A, Fall 2026

## Assignment # 1

### 1. Reference Materials

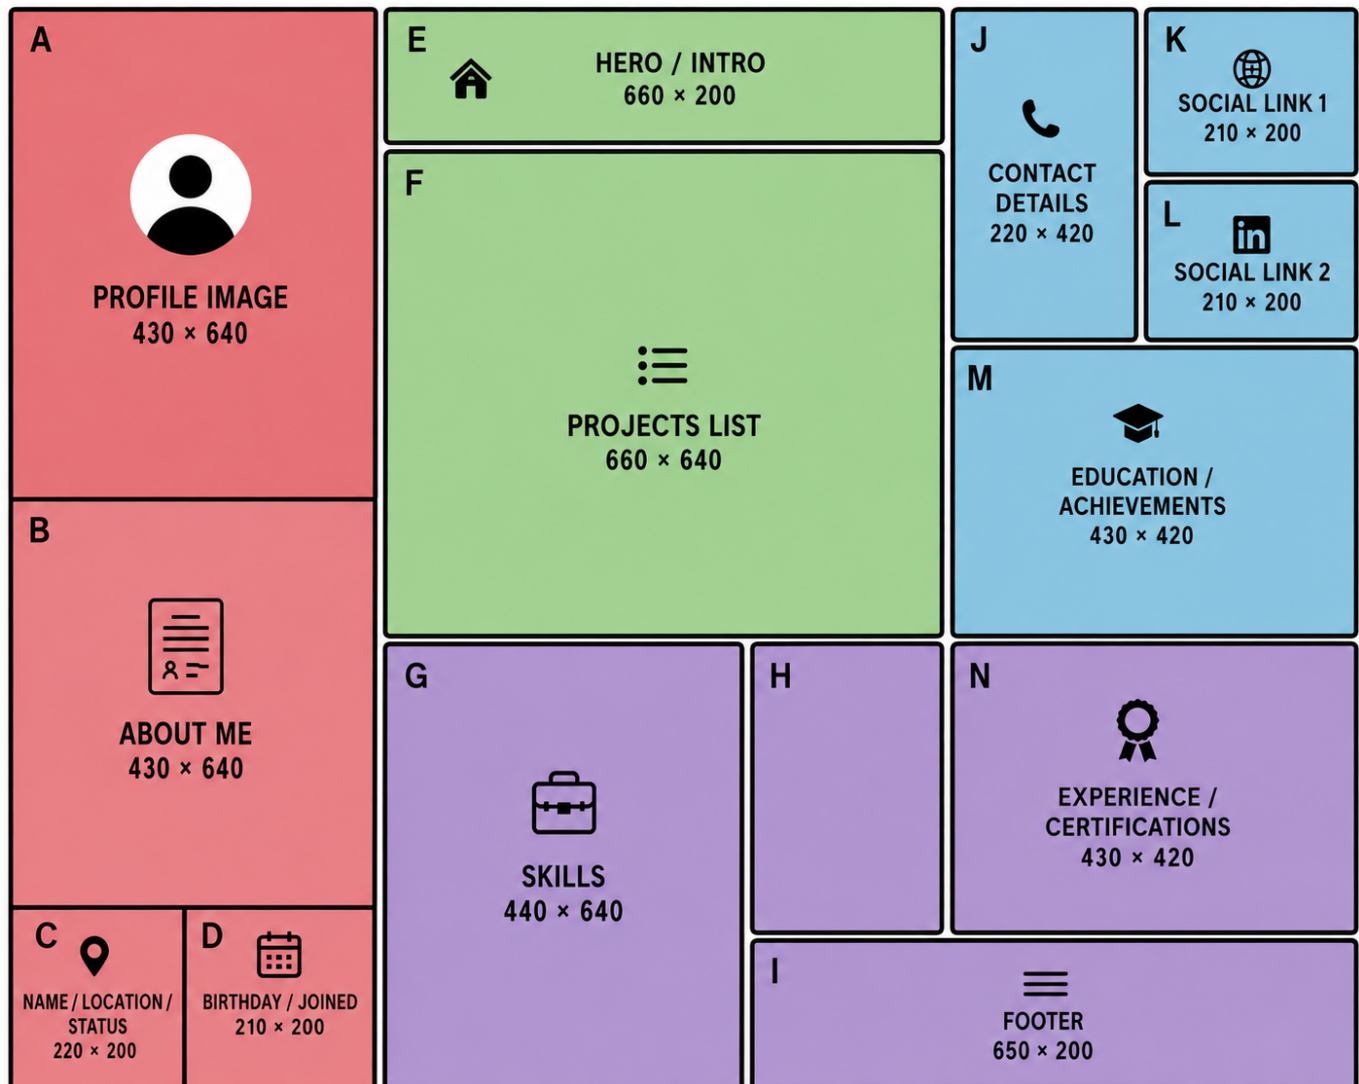

Two reference images are provided below. The dimension plan is the primary reference for the desktop grid proportions. The colored portfolio mock-up explains what type of content belongs in each region.

#### A. Desktop Grid / Dimension Reference

*Supplied reference image : use the labelled box dimensions as proportional design units.*

## B. Portfolio Content Reference

*Supplied portfolio mock-up : this shows the intended content mapping.*

This cleaned-up version is provided to make the required content mapping easier to read. The labels A–N correspond to the dimension reference above. Use CSS Grid (or another non-absolute layout technique) to reproduce the relationships between the boxes.

## 2. Assignment Requirements

1. Create a single-page personal portfolio using semantic HTML and CSS.
2. The desktop version must follow the supplied Mondrian-style box arrangement and proportional dimensions. **Treat the dimensions as relative/proportional units**; do not simply hard-code a fixed 1520px canvas.
3. The main portfolio grid must be implemented with CSS Grid. Absolute positioning (position: absolute) is NOT allowed for the grid layout.
4. Make the site responsive. At minimum, provide two intentional views: desktop and mobile. Use media queries so the desktop composition changes into a mobile-friendly stacked layout.
5. Add a navigation bar at the top, similar in placement to the reference. You may freely choose its colors, typography, spacing, borders, and other visual styling.
6. Use appropriate links for contact/social items. Social icons may be text, CSS, SVG, or image assets, but they must function as links.
7. Choose your own visual theme. The reference colors are only for distinguishing regions and are not mandatory.

## 3. Required Content Structure

Every labelled region A – N must be represented in your page. The content below defines what should go inside each region. You may add small decorative elements, but do not remove the required information.

| Box | Section           | Required information                                                                                                  |
|-----|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| A   | Profile Image     | A profile/avatar image. Use an <code>&lt;img&gt;</code> element and provide meaningful alt text.                      |
| B   | About Me          | A short introduction (approximately 80–150 words) describing yourself, interests, and what you are learning/building. |
| C   | Name / Role       | Your name and a short role/title, e.g. “Student Developer” or “Computer Science Undergraduate.”                       |
| D   | Location / Status | A short secondary detail such as city, availability, graduation year, or area of interest.                            |

|   |                             |                                                                                                                                                              |
|---|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E | Hero / Intro                | A short headline/tagline introducing the portfolio.<br>Example: "I build clean, accessible web experiences."                                                 |
| F | Projects List               | A list of at least 3 projects: Project 1, Project 2, Project 3, etc. Each project must have a title, short description, and technology/tools used.           |
| G | Skills                      | A clearly structured list of technical skills.                                                                                                               |
| H | Experience / Certifications | A short list of relevant experience, internships, activities, certifications, or achievements. If you have none, use coursework/academic experience instead. |
| I | Footer                      | A footer containing copyright/year text.                                                                                                                     |
| J | Contact Details             | At least 1 contact method, such as email.                                                                                                                    |
| K | Social Link 1               | One social/professional profile link, such as GitHub, LinkedIn, or another appropriate platform. Use an icon or compact visual treatment for this link.      |
| L | Social Link 2               | A second social/professional profile link. Use an icon or compact visual treatment for this link.                                                            |
| N | Education / Achievements    | Your education background, such as degree/program, university, expected graduation year, and notable academic achievements.                                  |

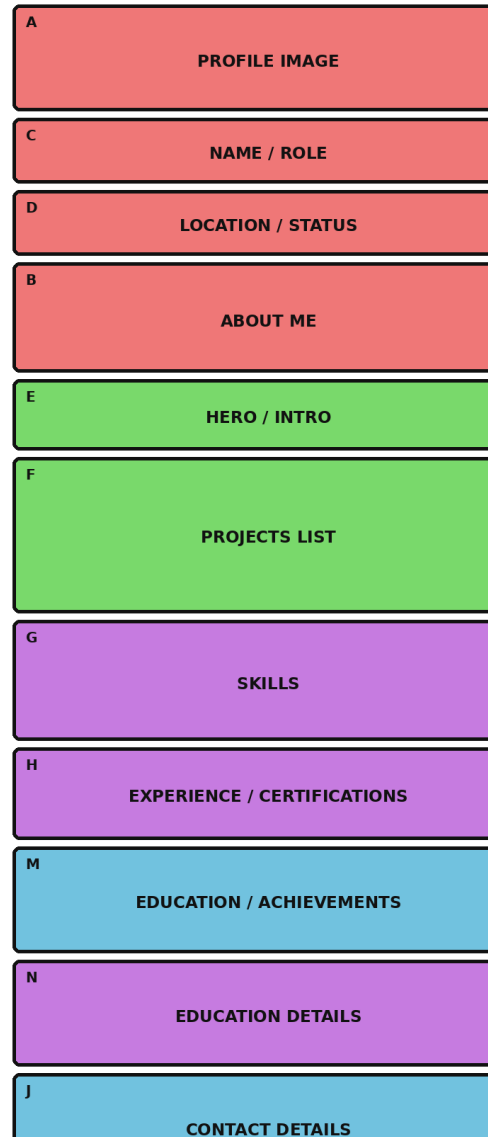

**Important:** The labels A–N are identifiers for the assignment and do not need to appear on the final website. Similarly, the dimension labels from the reference image should not be copied into the final portfolio.

## 4. Mobile View Requirement

On a narrow screen, the desktop composition should not be squeezed into a tiny canvas. Instead, rearrange the regions into a clean single-column flow. The exact order may be adjusted slightly if it improves usability, but every required section must remain accessible.

### MOBILE VIEW — STACKED LAYOUT

All required content remains visible; boxes stack vertically.

*Example mobile interpretation : simple stacked boxes are acceptable.*

## 5. Navigation Bar

Place a navigation bar above the portfolio grid. It should contain your name/portfolio title and links such as Home, About, Portfolio, and Contact. You are free to style the navbar as you wish. On mobile, make sure it remains usable (for example, by wrapping or stacking the links).

## 6. HTML/CSS Implementation Rules

- Use semantic HTML elements where appropriate: `<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, and `<footer>`.
- Use CSS Grid for the main Mondrian-style layout. Flexbox is recommended for the navbar and small horizontal groups.
- Do not use an HTML `<table>` to create the portfolio layout.
- Keep HTML structure and CSS in separate files (e.g. `index.html` and `style.css`).
- Do not place all styling in inline style attributes.
- Images must be responsive and should not overflow their containing region.
- Links should have visible hover and/or focus states.
